

METHOD AND SYSTEM FOR SECURE COMMUNICATION

ABSTRACT OF THE INVENTION

5 A method and system for secure communication is
presented. A virtual private proxy is generated based on
an agreement between a first entity and a second entity.
A first virtual private proxy is associated with the
first entity and a second virtual private proxy is
10 associated with the second entity. Data associated with
the first entity is monitored at the virtual private
proxy. Whether the data violates the agreement is
determined and communication of the data from the first
virtual private proxy to the second virtual private proxy
15 is disallowed when the data violates the agreement.
